

PLAYBOOK 05 · CRO

CONVERSION RATE OPTIMISATION

From Traffic to Frictionless Conversion

Platform: MNF.ai

Focus: Website Registration · Workshop Registration · Lead Generation · Landing Pages · UX · Funnel Optimisation · CRO

Core Approach: Observe → Diagnose → Hypothesise → Experiment → Optimise → Measure

10.5K+

ACCOUNT REGISTRATIONS

60%+

OBSERVED REGISTRATIONS
AFTER CRO WORK

2-FIELD

INITIAL REGISTRATION FORM

"Don't optimise the traffic in isolation. Optimise what happens after the click."

VINEETH CHAINI | OPERATIONAL PLAYBOOK

Business Context & CRO Objectives

THE PROBLEM WASN'T ONLY GETTING TRAFFIC

MNF.ai was generating traffic through Google Ads, Meta Ads, Organic Search and social channels. The next challenge was converting that traffic into meaningful user actions.

PRIMARY CONVERSION JOURNEY

Paid / Organic Traffic

- ↓ **Landing Page**
- ↓ **Sign Up Page**
- ↓ **Account Created**
- ↓ **Free Trial Activated**

ADDITIONAL CONVERSION JOURNEYS

Workshop Funnel:

Workshop Traffic → Workshop Landing Page → Registration → Confirmation

Lead Generation Funnel:

Ad / Website Traffic → Landing Page → Lead Form → Qualified Lead

THE CRO CHALLENGE

The initial UX was largely opinion-driven. Behavioural and funnel evidence showed:

- Users were encountering unnecessary steps.
- Navigation created friction & forms created hesitation.
- Mobile users experienced usability issues.
- Messaging and flow were longer than necessary.
- Users clicked elements that were not interactive.
- Back-and-forth navigation & visible form abandonment.
- Excessive scrolling reduced progression.

STRATEGIC OBJECTIVES

- **Reduce friction:** Make the path to conversion shorter and clearer.
- **Improve mobile experience:** Design around mobile behaviour rather than treating mobile as secondary.
- **Increase completed registrations:** Improve progression from landing-page visit to account creation.
- **Improve downstream activation:** Make the transition from account creation to product usage seamless.
- **Build evidence-led optimisation:** Replace opinion-led UX decisions with behavioural and funnel evidence.

CORE PRINCIPLE

"A landing page is not successful because it gets a click. It is successful when the user can easily take the next meaningful action."

Diagnose: From Opinion to Evidence

Instead of assuming what users wanted, I used behavioural and funnel data to identify where the experience was creating friction.

Microsoft Clarity

- Session recordings
- Heatmap behaviour
- Repeated clicks
- Dead clicks
- Navigation behaviour
- Excessive scrolling
- Form abandonment
- Mobile interaction patterns

PostHog

- Funnel progression
- User journeys
- Account creation behaviour
- Drop-off between registration and activation

GA4

- Funnel progression
- Page-level behaviour
- Drop-off points
- Conversion journeys

Google Ads / Meta

- Traffic quality
- Conversion signals
- Landing-page behaviour
- Acquisition-to-conversion relationship

Friction Identified (Diagnostic Decision Table)

Signal Observed	What It Suggested	CRO Direction
Dead / repeated clicks	Users expected elements to be interactive	Improve interaction clarity
Navigation friction	Users struggled to find the next step	Simplify navigation
Form abandonment	Registration required too much effort	Reduce initial fields
Excessive scrolling	Important information/action was too far down	Improve hierarchy
Mobile friction	Experience was not sufficiently mobile-first	Rework mobile flow
Back-and-forth navigation	Journey contained unnecessary steps	Simplify conversion path
Activation drop-off	Account creation was not the end goal	Improve post-registration experience

THE KEY DIAGNOSIS

The problem was not one isolated UX element. The friction existed across the journey — messaging, navigation, forms, page structure and the number of steps required to reach conversion.

CRO Framework: A System for Conversion Optimisation

A structured, repeatable methodology moving from user intent to validated implementation.

01 · UNDERSTAND (Business Objective → User Intent → Conversion Goal)

Define what the user and business are trying to achieve.

02 · DIAGNOSE (Behaviour → Funnel → Friction)

Combine behavioural recordings with quantitative funnel data.

03 · HYPOTHESISE (Signal → Problem → Hypothesis)

Translate observed friction into a testable assumption.

04 · EXPERIMENT (Version 1 → Change → Version 2)

Test changes through landing-page experiments, Meta A/B testing and Google Ads experiments.

05 · IMPLEMENT (UX Direction → Development → Deployment)

Own the CRO direction while working with developers where implementation requires technical support.

06 · MEASURE (Behaviour → Progression → Conversion)

Measure whether the change improves the intended user action.

07 · ITERATE (Result → Learning → Next Hypothesis)

Successful changes become part of the improved experience; unresolved friction generates the next experiment.

OPERATING PRINCIPLE

"CRO is not a one-time redesign. It is a continuous process of finding friction, testing hypotheses and learning from user behaviour."

Optimisation: Reducing Friction Across the Journey

02 · REDUCED REGISTRATION FIELDS (NAME + EMAIL)

The initial registration requirement was reduced to **NAME + EMAIL**. Phone number was removed from the first interaction because asking for additional personal information too early could create hesitation.

Once the account was created, automated emails were used to prompt users to complete and enrich their profile.

PROGRESSION ARCHITECTURE

Initial Registration (2 Fields)

↓ **Account Created**

↓ **Profile Enrichment Later**

Capture minimum info to move forward; enrich profile later.

01 · MOBILE-FIRST EXPERIENCE

Evaluated with mobile behaviour as a primary consideration.

Focus: Mobile layout · CTA visibility · Page hierarchy · Interaction clarity · Reduced unnecessary scrolling · Simplified progression

03 · SIMPLIFIED NAVIGATION

Navigation and page structure reviewed based on observed user behaviour.

Direction: Less distraction → clearer hierarchy → clearer next action

04 · IMPROVED FLOW & MESSAGING

Refined to reduce unnecessary steps and improve alignment between:

Ad → Landing Page → Sign Up → Account Creation

05 · CTA OPTIMISATION

CTA placement, visibility and messaging were reviewed to make the intended next action clearer.

06 · AUTOMATED VERIFICATION

Incorporated automatic verification with CAPTCHA, reducing unnecessary manual friction while maintaining the required verification step.

07 · AUTOMATIC FREE-TRIAL ACTIVATION

Made Free Trial activation automatic after registration, removing an additional step between:

Account Created → Product Trial (making registration a more meaningful conversion event)

Experimentation & Decision Log

CRO changes were not treated as a single redesign. Multiple experiments were used to understand which changes improved progression.

EXPERIMENTATION CHANNELS

Meta: A/B testing across landing-page experiences.

Google Ads: Experiments and campaign-level testing to evaluate performance against the existing experience.

VERSION 1 → VERSION 2 PROGRESSION

Version 1 (Original experience) → Behavioural & Funnel Analysis → CRO Hypotheses → Multiple Experiments → Version 2 (New experience) → Comparison & Validation → Version 2 became the primary Sign Up experience.

Optimisation Decision Log

Signal	Decision	Strategic Rationale
Form abandonment	Reduce initial fields	Lower commitment barrier
Mobile friction	Prioritise mobile-first UX	Improve usability for mobile traffic
Navigation difficulty	Simplify navigation	Reduce unnecessary decision points
Excessive scrolling	Rework page hierarchy	Bring important information/actions closer
Repeated / dead clicks	Improve interaction clarity	Match interface behaviour with user expectations
Long conversion flow	Simplify journey	Reduce steps between intent and conversion
Registration → Trial gap	Automate Free Trial activation	Remove unnecessary post-registration friction
Repeated experimentation	Promote Version 2	Make the improved experience the primary signup path

MY ROLE & EXECUTION OWNERSHIP

I owned the CRO diagnosis and optimisation direction, used behavioural and funnel data to identify friction, proposed and prioritised changes, and worked with the developer where implementation required technical support.

Results & Measurement Impact

Conversion Improvement Through Friction Reduction

10.5K+

ACCOUNT REGISTRATIONS

Available MNF.ai records show 10.5K+ account registrations.

60%+

OBSERVED AFTER CRO WORK

Approximately 60%+ of recorded registrations occurred after CRO work was implemented.

** Qualification: This is an observed distribution across the available records, not a claim that CRO alone caused 60%+ of registrations.*

BEHAVIOURAL IMPACT OBSERVED

↓ Form Abandonment

Reducing the initial information requirement lowered the commitment required from new users.

↑ Completed Registrations

More users progressed through the simplified registration experience.

↑ Mobile Progression

Mobile-first changes addressed observed layout and interaction friction.

↓ Unnecessary Steps

Simplified navigation and automated activation reduced avoidable actions.

↑ Landing-Page Progression

Improved messaging, hierarchy and CTA structure created a clearer path forward.

↑ Ad-to-Page Alignment

The landing experience was treated as part of the acquisition system rather than an isolated webpage.

Measurement Stack: Google Ads → GA4 → GTM → Clarity → PostHog → Conversion

The goal was not simply to increase clicks. It was to improve the probability that a qualified visitor would successfully progress through the funnel.

My CRO Operating System: From Traffic to Conversion

- 01 — **UNDERSTAND**: Business objective + user intent.
- 02 — **OBSERVE**: Behaviour + funnel data.
- 03 — **DIAGNOSE**: Identify friction.
- 04 — **HYPOTHESE**: Form a measurable assumption.
- 05 — **EXPERIMENT**: Test the experience.
- 06 — **IMPLEMENT**: Deploy the strongest direction.
- 07 — **MEASURE**: Evaluate behaviour + conversion.
- 08 — **LEARN**: Capture what changed.
- 09 — **ITERATE**: Form the next hypothesis.

What This Playbook Demonstrates

Evidence-led CRO

Using behavioural and quantitative data rather than relying solely on opinion.

Full-Funnel Thinking

Connecting acquisition traffic with landing-page experience, conversion journeys, registration and activation.

Mobile-First Optimisation

Treating mobile behaviour as a core conversion consideration.

Experimentation

Using Meta A/B testing and Google Ads experiments to evaluate changes.

Cross-Functional Execution

Owning the CRO direction while collaborating with developers for implementation.

Friction Reduction

Reducing unnecessary fields, steps, navigation and post-registration actions.

CLOSING THOUGHT

"The highest-impact CRO opportunity is often not a bigger CTA or a new headline. It is removing the unnecessary step that stands between user intent and action."

PORTFOLIO SCOPE

CRO results and examples shown here are based on available platform records and documented work from my experience at MNF.ai. Historical platform access is not available for all campaigns and periods. The 10.5K+ registration figure and associated CRO observations are based on available records; the 60%+ figure represents an observed distribution of registrations after CRO work, not an isolated causal attribution to CRO. Figures are rounded/approximate based on available data.
