Business Context & Objectives

MNF.ai was evolving from its legacy web presence into a redesigned platform and new domain. The challenge was not simply to improve rankings — it was to establish a technically sound website foundation, protect SEO equity during the transition, align content with search intent, and build reliable measurement across the user journey.

STARTING CHALLENGE & CORE CONTEXT

The website lifecycle created several connected requirements:

- Preserve organic value during the domain transition.
- Ensure important URLs remained discoverable and correctly mapped.
- Establish clean technical SEO foundations.
- Align website information with actual search intent.
- Reduce friction between organic discovery and conversion.
- Build reliable analytics and behavioural measurement.

Strategic Objectives

- Audit crawlability, indexation and technical structure.
- Map legacy URLs to the new domain using 1-to-1 redirects.
- Establish canonical, sitemap, robots and structured-data foundations.
- Map search intent to relevant website experiences.
- Connect SEO traffic with behavioural and conversion signals.
- Use analytics to identify UX friction and improve conversion paths.

CORE OPERATING PRINCIPLE

“SEO brings the visitor; UX moves them forward.”

SEO Across the Website Lifecycle

Legacy → Revamp & Domain Transition → MNF.ai Redesigned Platform

The SEO work evolved with the website rather than being treated as a one-time optimisation exercise.

01 — LEGACY WEBSITE

mynextfilm.com → mynextfilm.ai

Built the initial SEO foundation through:

- Technical SEO audits
- On-page optimisation
- Search-intent research
- Initial organic growth work

02 — REVAMP & TRANSITION

mynextfilm.ai → MNF.ai

Protected search foundation during migration:

- 1-to-1 301 URL mapping
- Canonical implementation
- robots.txt & XML sitemaps
- JSON-LD schema
- UX/CRO improvements

03 — REDESIGNED PLATFORM

MNF.ai Active Platform

Continued SEO and measurement after transition:

- Google Search Console
- GA4
- GTM custom events
- Microsoft Clarity
- PostHog
- Conversion-path tuning

KEY PRINCIPLE

“A website migration is not only a design project. It is also an SEO and measurement transition.”

Technical SEO Foundation

Crawl → Structure → Indexation → Search Understanding

The technical foundation was designed to make the redesigned website easier to crawl, understand and measure.

01 — CRAWL & AUDIT

Used Screaming Frog to inspect website structure and identify technical issues affecting crawlability and discoverability.

Focus: [Crawl paths](#) · [Metadata](#) · [Canonical paths](#) · [Technical structure](#)

02 — STRUCTURE & REDIRECTS

Built a migration framework around the relationship between the legacy and new website.

Focus: [1-to-1 URL mapping](#) · [301 redirects](#) · [Canonicals](#) · [XML sitemaps](#)

03 — SEARCH ENGINE UNDERSTANDING

Implemented structured information to improve how the website communicated its entities and content to search engines.

Focus: [JSON-LD](#) · [Organization schema](#) · [FAQ schema](#) · [Semantic structure](#)

04 — SEARCH INTENT

Used keyword and intent research to understand what users were actually looking for and align website content accordingly.

Tools: [Ahrefs](#) · [Ubersuggest](#) · [WordStream](#)

OPERATING PRINCIPLE

“Technical SEO creates the foundation. Search intent determines what should be built on top of it.”

Search Intent, UX & CRO

Search Intent → Landing Experience → Behaviour → Conversion

SEO was treated as more than generating a search visit. The next question was whether the landing experience matched the visitor's intent and helped them move toward the desired action.

01 — INFORMATION HIERARCHY & INTENT MATCH

Aligned search intent with landing-page hierarchy:

- Relevant information above the fold
- Clear product positioning
- Strong CTA visibility
- Reduced information friction

02 — LANDING EXPERIENCE

Ensured visitors arriving through organic search encountered an experience relevant to what they were looking for.

SEO brings the visitor. UX moves them forward.

03 — BEHAVIOURAL ANALYSIS

Microsoft Clarity: Session replays · Heatmaps · Navigation behaviour

PostHog: User cohorts · Journey analysis · Funnel behaviour

04 — FRICTION REDUCTION

Used behavioural signals to identify:

- Mobile navigation friction · Dead clicks
- Signup-form friction · Drop-off points

Then streamlined the registration experience for organic visitors.

KEY STRATEGIC SHIFT

“Don't optimise the search result in isolation. Optimise the experience that follows the search result.”

Measurement & SEO Diagnostic Framework

Connecting Search Visibility to User Behaviour

SEO performance was connected to broader website measurement rather than evaluated only through rankings.

MEASUREMENT STACK

Google Search Console: Search visibility · Search queries · Clicks · Average position

GA4: Website behaviour · User activity · Conversion measurement

Google Tag Manager: Custom events · DataLayer measurement · Tracking implementation

Microsoft Clarity: Session recordings · Heatmaps · UX friction

PostHog: User cohorts · Product behaviour · Journey analysis

SEO & Growth Diagnostic Framework

Signal Observed	Diagnostic Question	Strategic Action
Crawl / Indexation Lag	Is technical architecture preventing discovery or correct indexing?	Audit GSC coverage, validate canonical paths, update XML sitemaps
High Impressions / Low Clicks	Is the SERP result failing to match search intent?	Improve meta titles/descriptions and deploy relevant FAQ schema
Traffic / Low Signups	Is the landing experience creating friction?	Use Clarity to diagnose behaviour and streamline signup
Attribution Discrepancy	Are events or traffic sources being measured consistently?	Enforce UTM standards and unify events through GTM & GA4

CORE OPERATING PRINCIPLE

“SEO performance is not only about where a page ranks. It is also about what happens after the click.”

Results & Measurement Impact

Measurable search visibility, website engagement and behavioural data across available MNF.ai records.

KEY TAKEAWAY

The SEO work combined technical foundation, migration discipline, search-intent alignment, UX/CRO and analytics rather than treating organic search as a standalone ranking exercise.

MEASUREMENT INTEGRITY NOTE

Quantitative SEO results shown here are based on the available data in the current MNF.ai Google Search Console Domain Property. Historical GSC records from the previous domain are not available.

My Technical SEO & Analytics Operating System

- 01 — CRAWL:** Audit the website structure and identify crawl, technical and metadata issues.
- 02 — INDEX:** Validate canonical paths, redirects, robots directives and XML sitemaps.
- 03 — UNDERSTAND:** Use search-intent research and structured data to align the website with how users search and how search engines interpret content.
- 04 — MEASURE:** Connect GSC, GA4 and GTM to establish reliable visibility, behaviour and conversion measurement.
- 05 — DIAGNOSE:** Use search and behavioural signals to identify where the journey is breaking.
- 06 — OPTIMISE:** Improve information hierarchy, landing experiences, UX and conversion paths based on observed behaviour.
- 07 — ITERATE:** Continue refining the technical foundation, search experience and measurement system as the website evolves.

What This Playbook Demonstrates

Technical SEO · Website Migration · Crawl Auditing · Canonical Management · 301 Redirect Mapping · XML Sitemaps · Robots.txt · Structured Data · Search Intent Mapping · Google Search Console · GA4 · GTM · Behavioural Analytics · UX/CRO · Funnel Analysis · Hypothesis-Driven Optimisation

PORTFOLIO SCOPE

Quantitative SEO results shown here are based on available platform records from my work at MNF.ai. Current Google Search Console data represents the available records for the revamped MNF.ai domain; historical GSC records from the previous domain are not available. Figures are rounded/approximate based on available data.
